# LifeStream™ Management Suite

Create a More Complete Picture of Patient Health

The LifeStream™ Management Suite provides flexible, customized solutions that help streamline clinical workflows and improve care coordination throughout the care continuum. With robust reporting and analytical tools securely connected to patient data, it's easier to provide long-term remote patient monitoring while quantifying outcomes and justifying program expenses.

LifeStream provides a single consolidated view of patient information that allows care providers to effectively triage patients and make informed, data-driven decisions. By allowing care providers to customize patient care plans and their view of patient data, care providers may tailor the way they deliver patient care to effectively manage multiple patient populations.

Honeywell

LifeStream Management Suite

The LifeStream Management Suite consists of five applications:

- LifeStream Manager
- LifeStream Analytics
- LifeStream Connect
- LifeStream View
- LifeStream MobileHelp MH3 Care Provider Portal

LifeStream Manager Provides Effective, Flexible Workflows

Flexible, Customized Solutions:

Manage a large number of patients at any time, through a single dashboard. Care providers may also customize the configuration of their triage screen to meet specific clinical requirements.

Optimized Clinical Workflows:

Manage patients across multiple organizations in a single session.

Quality of Care:

The integration of telehealth data into a single view streamlines clinical workflows and provides a more complete view of the patient to enable care providers to make informed, data-driven, decisions.

Enhanced Security:

Regular and reliable clinical oversight enables aging in place, providing peace of mind for families and caregivers.

Scalability:

Honeywell enables care providers to expand their service base and scale their telehealth program to the size required to meet their business and clinical needs at any given time.

LifeStream Analytics Improves Accountability

Customize and assess telehealth program data to determine return on investment (ROI) and resource/care management.

With robust analytics tools to report results, care providers will better understand program metrics, quantify outcomes, justify expenses and leverage best practices.

Optimized operations may reduce costs and organizations will also be better able to manage workflows, track outcomes, manage program assets, patient loads and trends.

Analyze Data to Drive Efficiencies:

Scheduled and on-demand reports provide access to any data elements stored in LifeStream. These reports may be based on any user-defined parameters and time interval and may be saved for editing and reuse. In addition, LifeStream Analytics provides published queries, or reports based on clinical best-practices. Data extractions can be scheduled to automatically import this data into third-party tools or deliver data on demand.

LifeStream Connect Provides Data Integration

LifeStream Connect helps eliminate data entry redundancy and errors while providing increased access to clinical information across the care continuum.

Data Integration:

When electronic medical records (EMR) and electronic health records (EHR) are integrated into LifeStream through LifeStream Connect, care providers can leverage a single view of patient data to improve clinical workflows and care plan coordination.

Efficient Data Exchange:

With a wide selection of interfaces to standard EHR, EMR and other point-of-care applications, LifeStream Connect supports the efficient exchange of clinical data and helps meet meaningful use requirements of the Health Information Technology for Economic and Clinical Health (HITECH) program.

LifeStream Patient Portals Enhance Visibility

With patient portals, such as LifeStream View and LifeStream MobileHelp's MH3 Care Provider Portal, physicians, care providers, and family have ongoing visibility to the patient's health status.

LifeStream View:

Care providers may utilize LifeStream View locally via a browser-based interface to manage users and allow associated patients to see patient biometric data. LifeStream View enables physicians and clinicians to make informed decisions around the clock, no matter where they are.

LifeStream MobileHelp MH3 Care Provider Portal:

Using GPS and cellular technologies, care providers and family can view the patient's location at any given time and family members are notified after a button has been pushed.

Robust Patient Portals:

Care providers can grant access to patient's health information through the creation of patient portals, which can be configured for physicians, care providers and families.

Enhanced Security:

All patient portals are secured to prevent unauthorized access to patient data.
